

Testing & Inspection Companies

Appendix A Testing & Inspection Companies identifies independent testing and inspection companies with services pertinent to tire-derived products. These companies provide independent verification that the manufacturers and their products satisfy a wide variety of established standards. Many full-service laboratories offer a wide variety of specific tests used in many different industries including fire resistance, flammability, structural strength, weathering and durability, material properties, plumbing, electrical and a wide range of other tests. Most conduct testing at their laboratories, but some firms also offer field testing and on-site testing at your location. Some inspectors specialize in a number of field tests relevant to specialized industries like playground and sport surfacing. Testing laboratories and inspection companies must be appropriately certified as needed to satisfy established standards (e.g., ASTM), and must comply with related requirements. Confidentiality, independence, impartiality and integrity are important characteristics for a successful independent testing facility or inspection company.

As with other company categories included in this catalog, CalRecycle does not endorse the firms listed, and makes no representation regarding their specific qualifications. Catalog users are responsible for ensuring that listed firms, their products and services, satisfy their needs and requirements.
